Single Digitally-Controlled (XDCP™) Potentiometer

FEATURES

- 256 Resistor Taps
- 2-Wire Serial Interface for Write, Read, and Transfer Operations of the Potentiometer
- Wiper Resistance, 100Ω Typical @ 5V
- 16 Nonvolatile Data Registers for Each Potentiometer
- Nonvolatile Storage of Multiple Wiper Positions
- Power-on Recall. Loads Saved Wiper Position on Power-up.
- Standby Current < 5µA Max
- V_{CC}: 2.7V to 5.5V Operation
- 50kΩ, 100kΩ Versions of End to End Resistance
- Endurance: 100,000 Data Changes per Bit per Register
- 100 yr. Data Retention
- 14 Ld TSSOP
- Low Power CMOS
- Pb-Free Plus Anneal Available (RoHS Compliant)

DESCRIPTION

The X9279 integrates a single digitally controlled potentiometer (XDCP) on a monolithic CMOS integrated circuit.

The digital controlled potentiometer is implemented using 255 resistive elements in a series array. Between each element are tap points connected to the wiper terminal through switches. The position of the wiper on the array is controlled by the user through the 2-Wire bus interface. The potentiometer has associated with it a volatile Wiper Counter Register (WCR) and a four nonvolatile Data Registers that can be directly written to and read by the user. The contents of the WCR controls the position of the wiper on the resistor array though the switches. Powerup recalls the contents of the default data register (DR0) to the WCR.

The XDCP can be used as a three-terminal potentiometer or as a two terminal variable resistor in a wide variety of applications including control, parameter adjustments, and signal processing.

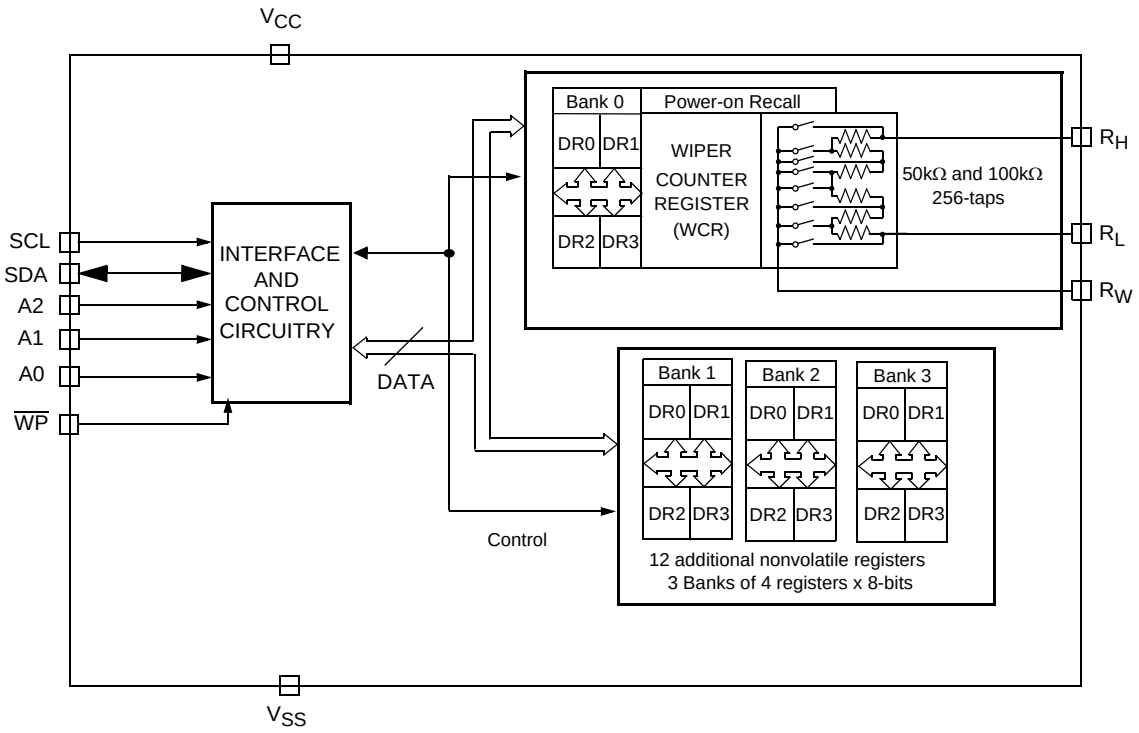
DETAILED FUNCTIONAL DIAGRAM



CIRCUIT LEVEL APPLICATIONS

- Vary the gain of a voltage amplifier
- Provide programmable dc reference voltages for comparators and detectors
- Control the volume in audio circuits
- Trim out the offset voltage error in a voltage amplifier circuit
- Set the output voltage of a voltage regulator
- Trim the resistance in Wheatstone bridge circuits
- Control the gain, characteristic frequency and Q-factor in filter circuits
- Set the scale factor and zero point in sensor signal conditioning circuits
- Vary the frequency and duty cycle of timer ICs
- Vary the dc biasing of a pin diode attenuator in RF circuits
- Provide a control variable (I, V, or R) in feedback circuits

SYSTEM LEVEL APPLICATIONS

- Adjust the contrast in LCD displays
- Control the power level of LED transmitters in communication systems
- Set and regulate the DC biasing point in an RF power amplifier in wireless systems
- Control the gain in audio and home entertainment systems
- Provide the variable DC bias for tuners in RF wireless systems
- Set the operating points in temperature control systems
- Control the operating point for sensors in industrial systems
- Trim offset and gain errors in artificial intelligent systems

PIN CONFIGURATION

PIN ASSIGNMENTS

Pin TSSOP	Symbol	Function
1	NC	No Connect
2	A0	Device Address for 2-Wire bus.
3	NC	No Connect
4	A2	Device Address for 2-Wire bus.
5	SCL	Serial Clock for 2-Wire bus.
6	SDA	Serial Data Input/Output for 2-Wire bus.
7	V_{SS}	System Ground.
8	$\overline{WP}$	Hardware Write Protect
9	A1	Device Address for 2-Wire bus.
10	A3	Device Address for 2 wire-bus.
11	R_W	Wiper Terminal of the Potentiometer.
12	R_H	High Terminal of the Potentiometer.
13	R_L	Low Terminal of the Potentiometer.
14	V_{CC}	System Supply Voltage.

PIN DESCRIPTIONS

Bus Interface Pins

SERIAL DATA INPUT/OUTPUT (SDA)

The SDA is a bidirectional serial data input/output pin for a 2-Wire slave device and is used to transfer data into and out of the device. It receives device address, opcode, wiper register address and data sent from an 2-Wire master at the rising edge of the serial clock SCL, and it shifts out data after each falling edge of the serial clock SCL.

It is an open drain output and may be wire-ORed with any number of open drain or open collector outputs. An open drain output requires the use of a pull-up resistor. For selecting typical values, refer to the guidelines for calculating typical values on the bus pull-up resistors graph.

SERIAL CLOCK (SCL)

This input is used by 2-Wire master to supply 2-Wire serial clock to the X9279.

DEVICE ADDRESS (A2 - A0)

The Address inputs are used to set the least significant 3 bits of the 8-bit slave address. A match in the slave address serial data stream must be made with the Address input in order to initiate communication with the X9279. A maximum of 8 devices may occupy the 2-Wire serial bus.

Potentiometer Pins

R_H, R_L

The R_H and R_L pins are equivalent to the terminal connections on a mechanical potentiometer.

R_W

The wiper pin is equivalent to the wiper terminal of a mechanical potentiometer.

Bias Supply Pins

SYSTEM SUPPLY VOLTAGE (V_{CC}) AND SUPPLY GROUND (V_{SS})

The V_{CC} pin is the system supply voltage. The V_{SS} pin is the system ground.

Other Pins

NO CONNECT

No connect pins should be left open. This pins are used for Intersil manufacturing and testing purposes.

HARDWARE WRITE PROTECT INPUT ($\overline{WP}$)

The $\overline{WP}$ pin when LOW prevents nonvolatile writes to the Data Registers.

www.BDTIC.com/Intersil

PRINCIPLES OF OPERATION

The X9279 is a integrated microcircuit incorporating a resistor array and associated registers and counter and the serial interface logic providing direct communication between the host and the digitally controlled potentiometers. This section provides detail description of the following:

- **Resistor Array Description.**
- **Serial Interface Description.**
- **Instruction and Register Description.**

Array Description

The X9279 is comprised of a resistor array (See Figure 1). The array contains, in effect, 255 discrete resistive segments that are connected in series. The physical ends of each array are equivalent to the fixed terminals of a mechanical potentiometer (R_H and R_L inputs).

At both ends of each array and between each resistor segment is a CMOS switch connected to the wiper (R_W) output. Within each individual array only one switch may be turned on at a time.

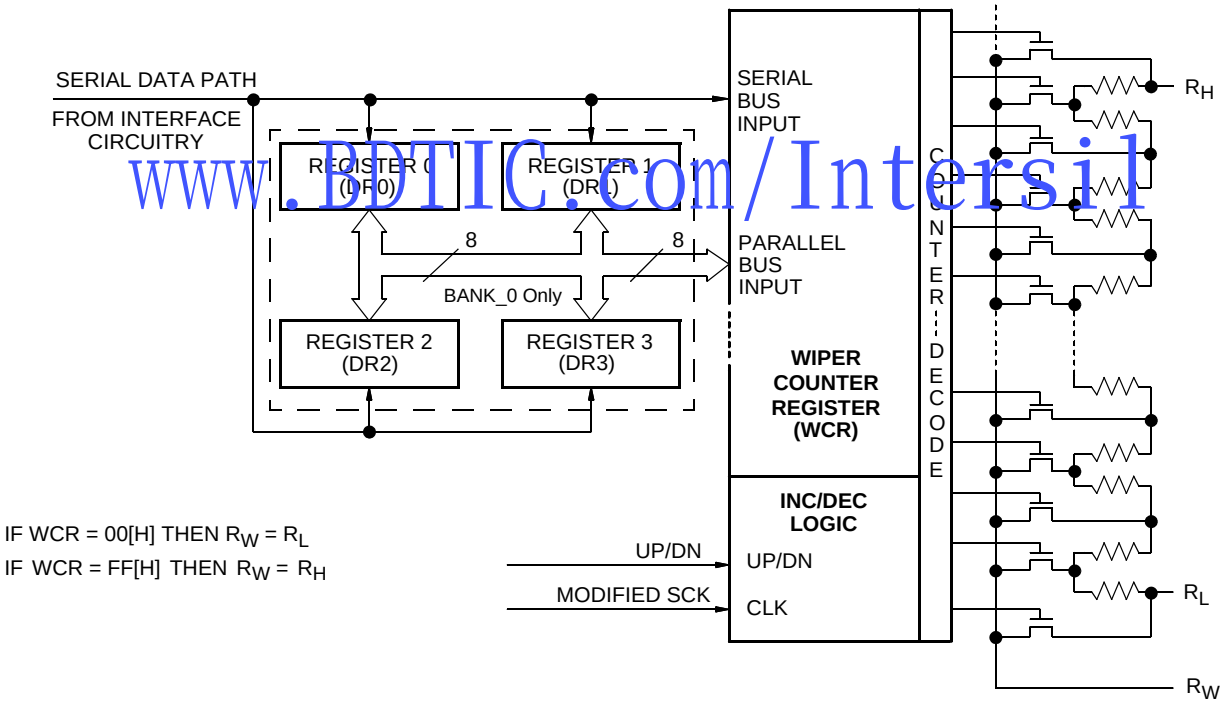
These switches are controlled by a Wiper Counter Register (WCR). The 8-bits of the WCR (WCR[7:0]) are decoded to select, and enable, one of 256 switches (See Table 1).

The WCR may be written directly. These Data Registers can the WCR can be read and written by the host system.

Power-up and Down Recommendations.

There are no restrictions on the power-up or power-down conditions of V_{CC} and the voltages applied to the potentiometer pins provided that V_{CC} is always more positive than or equal to V_H, V_L, and V_W, i.e., $V_{CC} \geq V_H, V_L, V_W$. The V_{CC} ramp rate specification is always in effect.

Figure 1. Detailed Potentiometer Block Diagram



www.BDTIC.com/Intersil

SERIAL INTERFACE DESCRIPTION

Serial Interface

The X9279 supports a bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master will always initiate data transfers and provide the clock for both transmit and receive operations. Therefore, the X9279 will be considered a slave device in all applications.

Clock and Data Conventions

Data states on the SDA line can change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating start and stop conditions. See Figure 2.

Start Condition

All commands to the X9279 are preceded by the start condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The X9279 continuously monitors the SDA and SCL lines for the start condition and will not respond to any command until this condition is met. See Figure 2.

Stop Condition

All communications must be terminated by a stop condition, which is a LOW to HIGH transition of SDA while SCL is HIGH. See Figure 2.

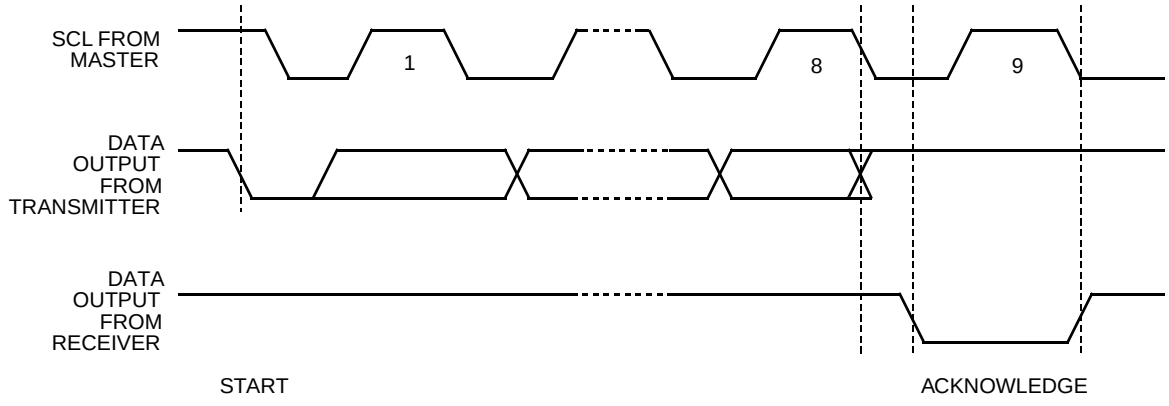
Acknowledge

Acknowledge is a software convention used to provide a positive handshake between the master and slave devices on the bus to indicate the successful receipt of data. The transmitting device, either the master or the slave, will release the SDA bus after transmitting eight bits. The master generates a ninth clock cycle and during this period the receiver pulls the SDA line LOW to acknowledge that it successfully received the eight bits of data.

The X9279 will respond with an acknowledge after recognition of a start condition and its slave address and once again after successful receipt of the command byte. If the command is followed by a data byte the X9279 will respond with a final acknowledge. See Figure 2.

Figure 2. Acknowledge Response from Receiver

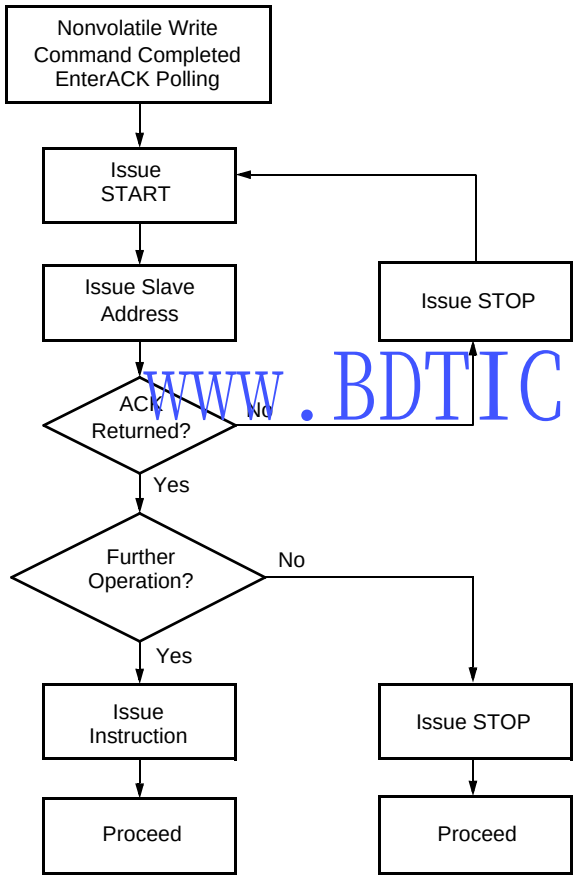
www.BDTIC.com/Intersil



Acknowledge Polling

The disabling of the inputs, during the internal nonvolatile write operation, can be used to take advantage of the typical 5ms EEPROM write cycle time. Once the stop condition is issued to indicate the end of the nonvolatile write command the X9279 initiates the internal write cycle. ACK polling, Flow 1, can be initiated immediately. This involves issuing the start condition followed by the device slave address. If the X9279 is still busy with the write operation no ACK will be returned. If the X9279 has completed the write operation an ACK will be returned and the master can then proceed with the next operation.

FLOW 1: ACK Polling Sequence



INSTRUCTION AND REGISTER DESCRIPTION

Device Addressing: Identification Byte (ID and A)

The first byte sent to the X9279 from the host, following a $\overline{CS}$ going HIGH to LOW, is called the Identification byte. The most significant four bits of the slave address are a device type identifier. The ID[3:0] bits is the device ID for the X9279; this is fixed as 0101[B] (refer to Table 1).

The A[2:0] bits in the ID byte is the internal slave address. The physical device address is defined by the state of the A2 - A0 input pins. The slave address is externally specified by the user. The X9279 compares the serial data stream with the address input state; a successful compare of both address bits is required for the X9279 to successfully continue the command sequence. Only the device which slave address matches the incoming device address sent by the master executes the instruction. The A2 - A0 inputs can be actively driven by CMOS input signals or tied to V_{CC} or V_{SS}.

Instruction Byte (I)

The next byte sent to the X9279 contains the instruction and register pointer information. The three most significant bits are used provide the instruction opcode I[2:0]. The RB and RA bits point to one of the four Data Registers. P0 is the POT selection; since the X9279 is single POT, the P0 = 0. The format is shown in Table 2.

www.BDTIC.com/Intersil

Register Bank Selection (RB, RA, P1, P0)

There are 16 registers organized into four banks. Bank 0 is the default bank of registers. Only Bank 0 registers can be used for Data Register to Wiper Counter Register operations.

Banks 1, 2, and 3 are additional banks of registers (12 total) that can be used for 2-Wire write and read operations. The Data Registers in Banks 1, 2, and 3 cannot be used for direct read/write operations between the Wiper Counter Register.

Register Selection (R0 to R3) Table

RB	RA	Register Selection	Operations
0	0	0	Data Register Read and Write; Wiper Counter Register Operations
0	1	1	Data Register Read and Write; Wiper Counter Register Operations
1	0	2	Data Register Read and Write; Wiper Counter Register Operations
1	1	3	Data Register Read and Write; Wiper Counter Register Operations

Note: 1/0 = data is one or zero

DEVICE DESCRIPTION

Wiper Counter Register (WCR)

The X9279 contains contains a Wiper Counter Register, for the DCP potentiometer. The Wiper Counter Register can be envisioned as a 8-bit parallel and serial load counter with its outputs decoded to select one of 256 switches along its resistor array. The contents of the WCR can be altered in four ways: it may be written directly by the host via the Write Wiper Counter Register instruction (serial load); it may be written indirectly by transferring the contents of one of four associated data registers via the XFR Data Register instruction (parallel load); it can be modified one step at a time by the Increment/Decrement instruction (See Instruction section for more details). Finally, it is loaded with the contents of its Data Register zero (DR0) upon power-up.

The Wiper Counter Register is a volatile register; that is, its contents are lost when the X9279 is powered-down. Although the register is automatically loaded with the value in DR0 upon power-up, this may be different from the value present at power-down. Power-up guidelines are recommended to ensure proper loadings of the DR0 value into the WCR. The DR0 value of Bank 0 is the default value.

Data Registers (DR)

The potentiometer has four 8-bit nonvolatile Data Registers (DR3-DR0). These can be read or written directly by the host. Data can also be transferred between any of the four Data Registers and the associated Wiper Counter Register. All operations changing data in one of the Data Registers is a nonvolatile operation and will take a maximum of 10ms.

If the application does not require storage of multiple settings for the potentiometer, the Data Registers can be used as regular memory locations for system parameters or user preference data.

Bit [7:0] are used to store one of the 256 wiper positions (0~255).

Instructions

Four of the seven instructions are three bytes in length. These instructions are:

– **Read Wiper Counter Register** – read the current wiper position of the potentiometer,

– **Write Wiper Counter Register** – change current wiper position of the potentiometer,

– **Read Data Register** – read the contents of the selected Data Register;

– **Write Data Register** – write a new value to the selected Data Register.

The basic sequence of the three byte instructions is illustrated in Figure 4. These three-byte instructions exchange data between the WCR and one of the Data Registers. A transfer from a Data Register to a WCR is essentially a write to a static RAM, with the static RAM controlling the wiper position. The response of the wiper to this action will be delayed by t_{WRL}. A transfer from the WCR (current wiper position), to a Data Register is a write to nonvolatile memory and takes a minimum of t_{WR} to complete. The transfer can occur between the potentiometer and one of its four associated registers (Bank 0).

Two instructions require a two-byte sequence to complete. These instructions transfer data between the host and the X9279; either between the host and one of the data registers or directly between the host and the Wiper Counter Register. These instructions are:

– **XFR Data Register to Wiper Counter Register** – This transfers the contents of one specified Data Register to the Wiper Counter Register.

– **XFR Wiper Counter Register to Data Register** – This transfers the contents of the Wiper Counter Register to the specified Data Register.

The final command is Increment/Decrement (Figure 5 and 6). The Increment/Decrement command is different from the other commands. Once the command is issued and the X9279 has responded with an acknowledge, the master can clock the selected wiper up and/or down in one segment steps; thereby, providing a fine tuning capability to the host. For each SCL clock pulse (t_{HIGH}) while SDA is HIGH, the selected wiper will move one resistor segment towards the R_H terminal. Similarly, for each SCL clock pulse while SDA is LOW, the selected wiper will move one resistor segment towards the R_L terminal.

See Instruction format for more details.

Symbol	Parameter	Min.	Max.	Units
$t_r V_{CC}$(6)	V_{CC} Power-up rate	0.2	50	V/ms
t_{PUR}(7)	Power-up to initiation of read operation		1	ms
t_{PUW}(7)	Power-up to initiation of write operation		50	ms

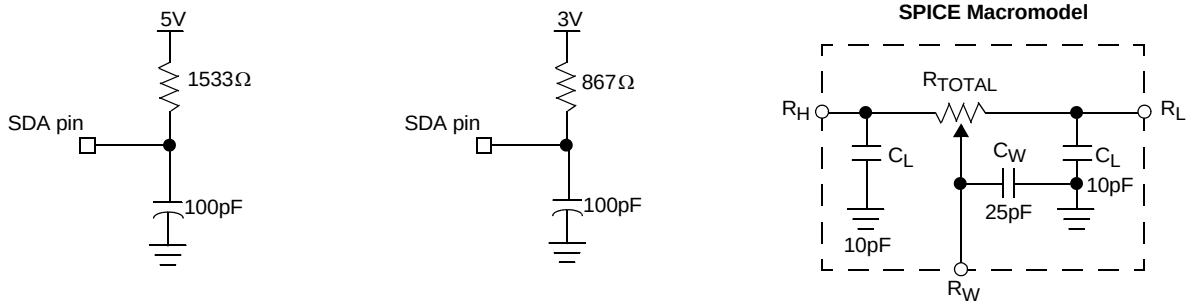
A.C. TEST CONDITIONS

Input Pulse Levels	V_{CC} x 0.1 to V_{CC} x 0.9
Input rise and fall times	10ns
Input and output timing level	V_{CC} x 0.5

Notes: (6) This parameter is not 100% tested

(7) t_{PUR} and t_{PUW} are the delays required from the time the (last) power supply (V_{CC}-) is stable until the specific instruction can be issued. These parameters are periodically sampled and not 100% tested.

EQUIVALENT A.C. LOAD CIRCUIT



AC TIMING

Symbol	Parameter	Min.	Max.	Units
f_{SCL}	Clock Frequency		400	kHz
t_{CYC}	Clock Cycle Time	2500		ns
t_{HIGH}	Clock High Time	600		ns
t_{LOW}	Clock Low Time	1300		ns
$t_{SU:STA}$	Start Setup Time	600		ns
$t_{HD:STA}$	Start Hold Time	600		ns
$t_{SU:STO}$	Stop Setup Time	600		ns
$t_{SU:DAT}$	SDA Data Input Setup Time	100		ns
$t_{HD:DAT}$	SDA Data Input Hold Time	30		ns
t_R	SCL and SDA Rise Time		300	ns
t_F	SCL and SDA Fall Time		300	ns
t_{AA}	SCL Low to SDA Data Output Valid Time		0.9	µs
t_{DH}	SDA Data Output Hold Time	0		ns
T_I	Noise Suppression Time Constant at SCL and SDA inputs	50		ns
t_{BUF}	Bus Free Time (Prior to Any Transmission)	1200		ns
$t_{SU:WPA}$	A0, A1 Setup Time	0		ns
$t_{HD:WPA}$	A0, A1 Hold Time	0		ns

HIGH-VOLTAGE WRITE CYCLE TIMING

Symbol	Parameter	Typ.	Max.	Units
t_{WR}	High-voltage write cycle time (store instructions)	5	10	ms

XDCP TIMING

Symbol	Parameter	Min.	Max.	Units
t_{WRPO}	Wiper response time after the third (last) power supply is stable	5	10	µs
t_{WRL}	Wiper response time after instruction issued (all load instructions)	5	10	µs

SYMBOL TABLE

WAVEFORM	INPUTS	OUTPUTS
	Must be steady	Will be steady
	May change from Low to High	Will change from Low to High
	May change from High to Low	Will change from High to Low
	Don't Care: Changes Allowed	Changing: State Not Known
	N/A	Center Line is High Impedance

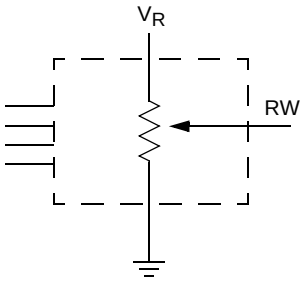
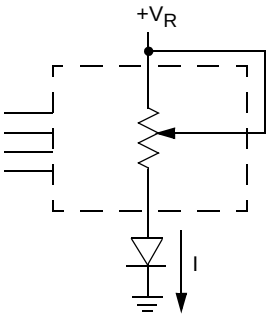
APPLICATIONS INFORMATION

Basic Configurations of Electronic Potentiometers



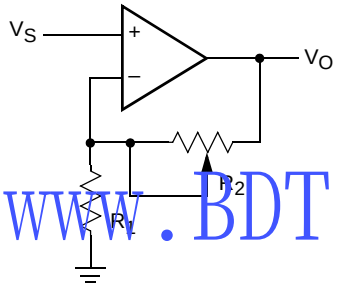
Three terminal Potentiometer;
Variable voltage divider



Two terminal Variable Resistor;
Variable current

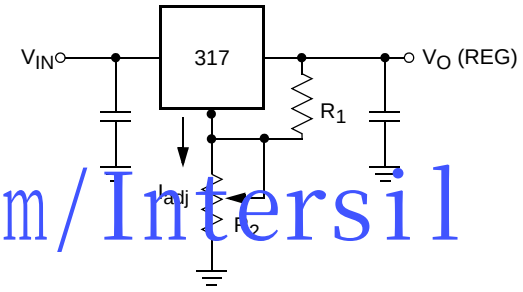
Application Circuits

Noninverting Amplifier



$V_O = (1+R_2/R_1)V_S$

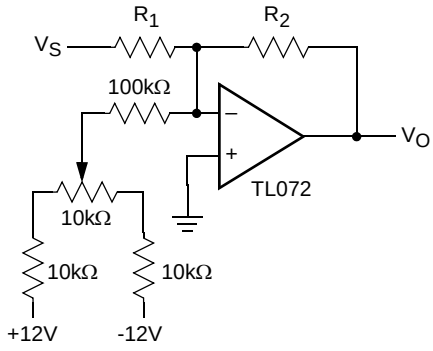
Voltage Regulator



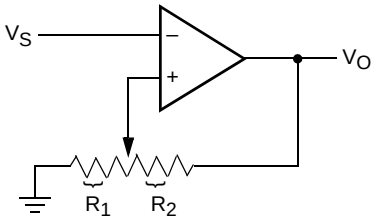
V_O (REG) = 1.25V $(1+R_2/R_1)+I_{adj}$ R_2

www.BDTIC.com/Intersil

Offset Voltage Adjustment



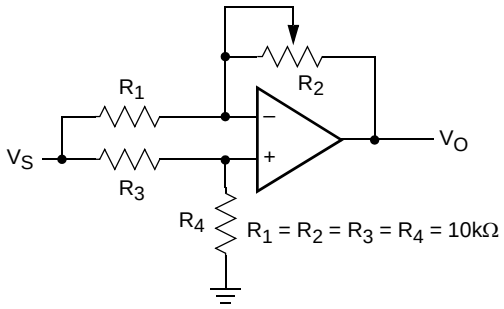
Comparator with Hysterisis



$V_{UL} = \{R_1/(R_1+R_2)\}\ V_O(max)$
$RL_L = \{R_1/(R_1+R_2)\}\ V_O(min)$

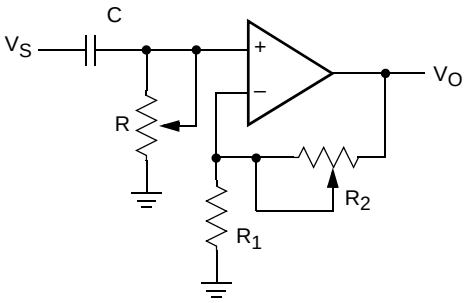
Application Circuits (continued)

Attenuator



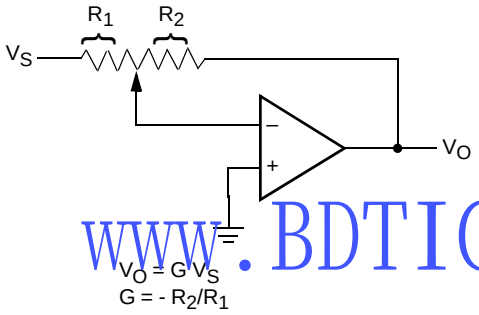
$V_O = G\ V_S$
$-1/2 \leq G \leq +1/2$

Filter



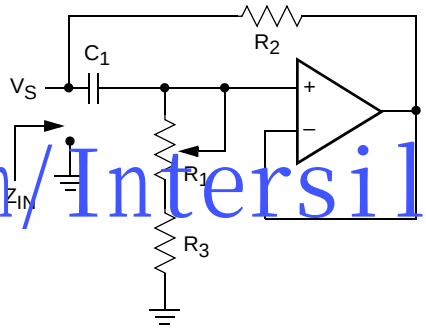
$G_O = 1 + R_2/R_1$
$fc = 1/(2\pi RC)$

Inverting Amplifier



$V_O = G\ V_S$
$G = -R_2/R_1$

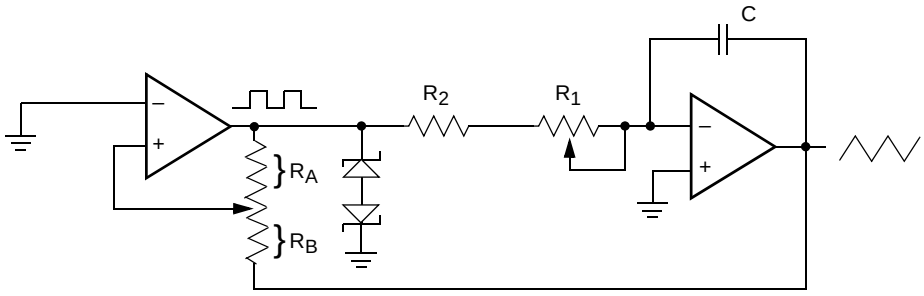
Equivalent L-R Circuit



$Z_{IN} = R_2 + s\ R_2\ (R_1 + R_3)\ C_1 = R_2 + s\ Leq$
$(R_1 + R_3) >> R_2$

www.BDTIC.com/Intersil

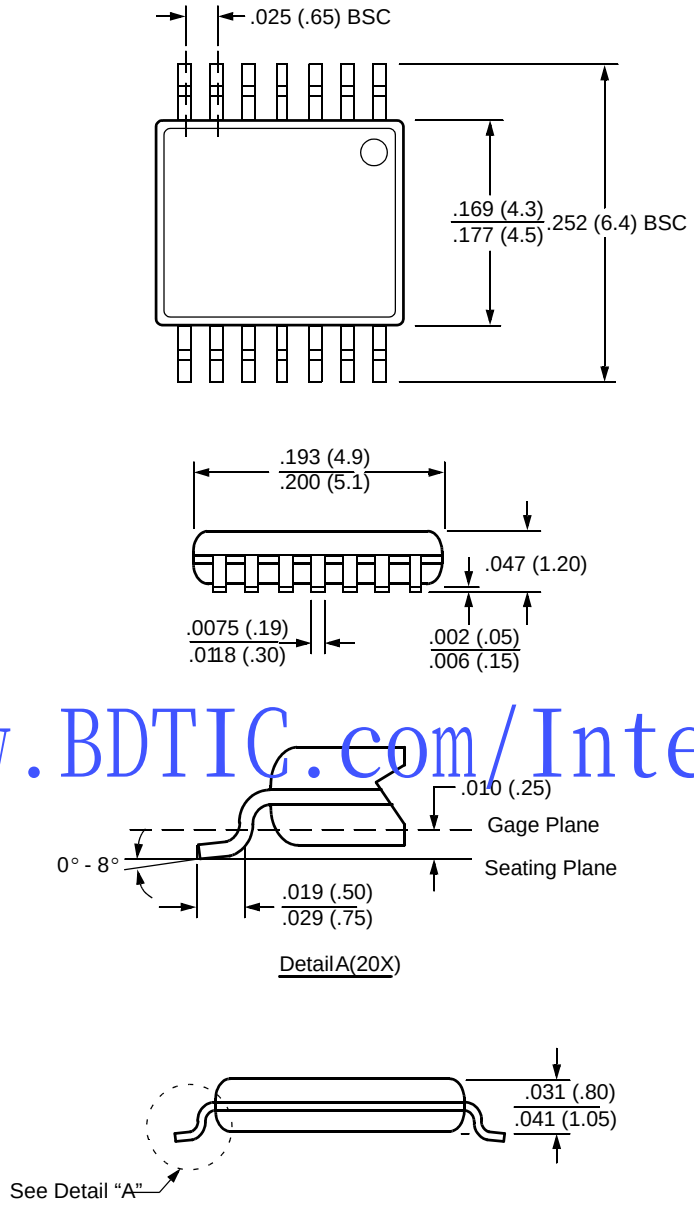
Function Generator



frequency ∝ R_1, R_2, C
amplitude ∝ R_A, R_B

PACKAGING INFORMATION

14-LEAD PLASTIC, TSSOP, PACKAGE TYPE V



www.BDTIC.com/Intersil

NOTE: ALL DIMENSIONS IN INCHES (IN PARENTHESES IN MILLIMETERS)

All Intersil U.S. products are manufactured, assembled and tested utilizing ISO9000 quality systems.
Intersil Corporation's quality certifications can be viewed at www.intersil.com/design/quality

Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design, software and/or specifications at any time without notice.
